```

The present sequence is that of a recombinant Erwinia herbicola phytoene dehydrogenase-4H (from pARC146D) which produces lycopene biosynthetically from phytoene through four sequential dehydrogenation reactions. Other carymes involved in the caroteened biosynthesis pathway include geranylgeranyl pyrophosphate (AAW01119), phytoene synthase (W0121) and lycopene cyclase (AAW01125), by in frame linkage to the chlorophast transit peptide (AAW01124) of the tobacco ribulose bis-phosphate carboxylase-cyclase gene can lead to increased production of total caroteenids in the chloroplast of transformed plants as compared to native, nontransformed plants of the same type. Beta-caroteen is an effective and apparently harmless food colourant and is also in the pathway for biological synthesis of further C40 caroteenids such as zeaxanthin and zeaxanthin diglucoside. (Updated on 25-MAR-2003 to correct PP field.) Increasing prodn. of total carotenoid(s) in a higher plant - by transforming with vector encoding chloroplast transit peptide operably linked to the Erwinia herbicola lycopene cyclase structural gene. GGPP synthase; lycopene cyclase; phytoene synthase; beta-carotene; phytoene dehydrogenase-4H; carotenoid, C40; zeaxanthin; diglucoside; pigment; food colourant; chloroplast transit peptide; increase yield; tobacco ribulose bis-phosphate carboxylase-oxygenase. Brwinia herbicola phytoene dehydrogenase-4H.

This sequence represents Erwinia herbicola phytoene dehydrogenase encoded by DNA from the plasmid pARC146D. Phytoene dehydrogenase is an enzyme which is involved in the biosynthesis of carotenoids, esp. lycopene, from the ubiquitous precursor, farmesyl pyrophosphate. In B. herbicola, phytoene has been found to be formed biosynthetically in a two-step process. The initial step is the condensation of farmesyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) to form GGPP. This reaction is catalysed by GGPP synthase. This first step is immediately followed by a tail to tail dimerisation of GGPP, catalysed by the enzyme phytoene synthase, to form phytoene Lycopene is produced from phytoene by the catalytic action of phytoene dehydrogenase-4H. The genes encoding components of the lycopene is production of lycopene which is used as a food colourant. Plants transformed with the phytoene dehydrogenase-4H coding sequence are protected from the herbicide norflurazon. (Updated on 15-5-MAR-2003 to correct PF field.) (Updated on 16-0CT-2003 to standardise

A novel DNA molecule has been isolated which encodes an Erwinia herbicola lycopene cyclase enzyme that converts lycopene to beta- carotene. The DNA molecule comprises at least 1125 bp and is present in the plasmids pARC147, pARC1509, pARC1510 and pARC1520. The present sequence represents the amino acid sequence corresponding to the structural gene for phytoene recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carotene levels. Beta- carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 25-MAR-2003 to correct PF field.) A cluster of structural and regulatory genes for light-induced carotemogenesis in Myzococcus xanthus.";

Bur. J. Blochem. 233:238-248(1995).
-!- FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
-!- COFACTOR: PAD (Probable).
-!- COFACTOR: PAD (Probable).
-!- PATHWAY: Carotemoid biosynthesis.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Myxococcus xanthus.

J. FUNCTION: This enzyme converts phytoene into zeta-carotene via the intermediary of phytofluene by the symmetrical introduction of two double bonds at the C.11 and C-11' positions of phytoene.
COGACTOR: FAD (Probable).
J. PATHWAY: Carotenoid and chlorophyll biosynthesis.
SIMILARITY: Belongs to the phytoene denydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. -!- FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical interoduction of double bonds at the C-11 and C-11' positions of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SEQUENCE FROM N.A.

"Elucidation of the Erwinia uredovora carotenoid biosynthetic pathway
by functional analysis of gene products expressed in Escherichia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description 172:6704-6712(1990).

J. Bacteriol. 172:6704-6712(1990).

-!- FUNCTION: This enzyme converts phytoene into lycopene via the intermediaries of phytofluene, zeta-carotene and neurosporene linermediaries of four double bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pantoea ananas (Brwinia uredovora).

Submitted (MAR-1994) to the EMBL/GenBank/DDBJ databases.
submitted (MAR-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This enzyme converts phytoene into zeta-carotene via t intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
-!- COFACTOR: FAD (Probable).
-!- RATHWAY: Carotenoid biosynthesis.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bukaryota; Pungi; Zygomycota; Zygomycetes; Mucorales; Mucoraceae;

"Nucleotide sequence of the methoxyneurosporene dehydrogenase from Rhodobacter phaeroides: comparison with other bacterial carotenoid dehydrogenases.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- COFACTOR: FAD (Probable).
-!- PATHWAY: Carotenoid and chlorophyll biosynthesis.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ; DB 1; Length 495; 5.9e-17;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FAD (ADP PART) (POTENTIAL).
